The Graphinator™ is the ultimate drilling reamer for composite materials. It's engineered to meet stringent aerospace tolerances and provide super clean holes with virtually no fiber break-out or delamination of layers. We have seen impressive results in composite stacks that contain aluminum honeycomb and phenolic as well. There are also variations of this tool that will easily drill/ream composite stacks that contain titanium and other metals that are difficult to drill.

Are you using hand-held drill motors or threaded chucks? No problem! We offer a variety of shank options including:

• *Hex and "V" Threaded* • *Tri-Flats* • *Quick Change* • *Straight Shank*

These characteristics make the Graphinator™ a very versatile tool able to be tailored to your specific application. Our tests on tool life vs cost have shown that this carbide tool is more economical than other tools made from expensive materials.
